

- Seal foam sheet x1
- Bamboo stick x1
- Carbon fiber tweezers x1
- Cotton swab x1
- Installation manual x1

It is relatively easy to replace your camera foam kit. We provide 3 sets of foam kits for most models. Note: Some 120 camera models may provided 2 sets only. Please follow the installation steps below. Even if you fail to install the first or second kit, we strongly believe in the third kit must be able to install successfully.

First of all, you need to prepare the following small tools, a piece of paper, adhesive tape, alcohol or water (the above 3 items are not included), small wooden sticks, cotton swabs, and tweezers which included in the package.

01

Process
Steps
步骤一

Cut the paper just enough to cover the shutter curtain, and fix the position with adhesive tape. This is to prevent the foam residue from falling onto the shutter curtain or tools accidentally hitting the shutter curtain and causing damage.

02

Process
Steps
步骤二

Use the small bamboo stick to remove the old foam, and clean up the residue again with rubbing alcohol.

03

Process
Steps
步骤三

Use tweezers to take out the foam strip from the base paper. Use a cotton swab dipped in alcohol or water to wipe on the sticky side of the foam. Alcohol or water can delay the stickiness, giving you enough time to adjust the positioning.
